

ABSTRACT OF THE DISCLOSURE

A communication system and method for supporting multiple languages
5 for a mobile communication terminal. The system and method include a mobile
communication network, a multiple language contents provider server (MLCPS)
connected to the mobile communication network and having multiple language
contents, and a mobile communication terminal wirelessly connected to the
mobile communication network. The mobile communication terminal connects to
10 the MLCPS through the mobile communication network, and transmits language
package request data including at least one string set version and one font set
version to the MLCPS according to request of a user. The mobile communication
terminal also receives language package information provided by the MLCPS,
divides the received language package information into a string set and a font set
15 corresponding to languages and manages the string set and the font set, and
displays menus and messages on a display window of the mobile communication
terminal by a language selected by a user using the managed string set and font
set. The MLCPS forms a corresponding language package in response to
reception of the language package request data and transmits the language
20 package to the mobile communication terminal through the mobile
communication network.
